The present sequence is that of the orb-weaver spider (Nephila clavipes) recombinant silk protein pETNCDS. The invention provides for purifying and spinning spider silks and other structural proteins. Organic acids are used to lyse recombinant cells or other biological samples (such as non-recombinantly cells or other biological samples (such as non-recombinantly derived cells), and enrich the purity and yields of structural proteins intact. In the case of silk proteins, the structural proteins intact. In the case of silk proteins, the resulting lysate is further purified by ion-exchange or affinity of promappraphy and processed into an aqueous-based mixture for fibre spinning. In the present case, the pETNCDS gene was cloned into vector pET24 for recombinant expression in Escherichia coll, and recombinant silk protein was obtained using formic acid containing denaturant (3 M quanidine-HCI) and by affinity chromatography on nickel-NTA agarose. Products obtained using the method so of the invention can be used in the construction of many materials including films, fibres, woven articises, surfares, surfares, ballistic protection, parachtes and parachute cords. The new method has the following advantages over prior art: it involves center steps, requires less time and smaller volumes of reagents, results in better recovery of protein at higher purity (70-99%), is easy to scale up, and the fibres are spun in an environmentally benign solution reducing hazardous waste accumulation and cost. Recovering structural polypeptides in a biological sample, useful for purifying and spinning spider silks and other structural proteins, comprises treating the sample containing the polypeptides with an acid Butler MM; Claim 2; Page 41-42; 49pp; English. encoding silk protein. The process involves: (a) selecting target DNA, crown a silk protein. The process involves: (a) selecting target DNA, from a silk-producing spider, that contains many repetitive and non-repetitive regions: (b) selecting a single-stranded DNA primer of at least 10 nucleotides with a sequence that is complementary to a region of the target; (c) repetitively combining the primer with melted target DNA, incubating the mixture with nucleotides and a DNA polymerase with prooffereding activity to produce a DNA fragment which is complementary to the target and is at least 2 kb long. The present sequence encodes the spider silk protein from Nephila clavipes. The DNA fragment can be used to make fibres, films, woven articles, e.g. for use in parachutes, sails, body armour, and absorbers (e.g. of heavy metals, biological weapons, DNA, chemicals, flavours and fragrances). The high molecular weight (90-250 kD) of spider silk proteins can be produced on a strength and elasticity than silkworm silk. Inclusion of both repetitive and non-repetitive regions ensures isolation of stable clones. New opt. multimerised DNA sequences encoding spider silk protein contg. both repetitive and non-repetitive sequences, useful for making high strength films, fibres, woven articles etc. High strength film; fibre; woven article; parachutes; sails; absorber; body armour; heavy metal; biological weapon; chemical; flavour; fragrance; Nephila clavipes. The present sequence represents a spider silk protein from the present invention. Spider silk proteins, and peptide fragments within the proteins, can be produced and purified independently and can then be mixed and made into fibres that have higher tensile strengths and elasticity than naturally occurring fibres. The fibres can be used in mixed composites. The invention allows the two naturally occurring Nephila clavipes silk proteins to be produced independently so that they can later be combined to form silk fibres of high tensile strength and elasticity.

The spider silk protein contains a basic 34 amino acid repeat. The repeat itself contains 3 regions. The first comprises 0-9 amino acids with a sequence AGR(GGX)2. This region is not highly conserved. The second region has a sequence GAG(A)x which is highly conserved and is 8-10 amino acids long. The third segment is (GGX)5 and is 15 amino acids long and 1s very highly conserved. In most cases X is A,O, Y or L. Removal of the poly-(Ala) segments results in a silk having lower elasticity.

                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention provides isolated cDNA molecules coding for spider silk proteins. The spider silk proteins are characterized by repeating alpha and beta regions and optional variable regions. The DNA sequences are useful in the production of spider silk protein by recombinant DNA techniques. The recombinant spider silk proteins may be used for the production of fibers. The present sequence represents the spider silk protein 1, derived from the major ampullate gland of Nephila clavipes.

                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents the natural spider silk protein spidroine major 1. The protein Improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of producing silk-like proteins (SLP) in a green plant by providing a green plant containing an SLP expression cassette. The green plant contains the expression cassette P-SLP-T where P is a promoter for driving the expression of an SLP transgene and T is a 5' terminator. The method is useful for producing silks and silk-like proteins in green plants. The silks and silk-like proteins may be used in fabrics or in material construction, such as rope, surgical sutures, flexible tie downs for certain electrical components, or as a biomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is one-weaving spider spidroinl, a natural silk the method of the invention.
                                                                                                                                                   Orb-weaving spider; spidroin 1; silk-like protein; SLP; transgenic plant; promoter; 5' terminator; fabric production; material construction; rope; surgical suture; flexible tie down; electrical component; implantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAAGGAGGGGYGGLGSQGAGRGGLGGQGAG--AAAAAGGVGQGGLGG---QGAGQGA-GA 119

This invention describes a novel DNA sequence, encoding a synthetic spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotides, each oligonucleotide encoding a repeating unit of a spidroin protein. The synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly; (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (1i) as adhession surfaces for culturing cells; and (1ii) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). Also they retain water solubility after long-term boiling in aqueous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      closing

This invention describes a novel DNA sequence, encoding a synthetic spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotides, each oligonucleotide encoding a repeating unit of a spidroin protein. The synthetic protein has at repeating unit of a spidroin protein. The synthetic protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (11) as adhesion surfaces for culturing cells; and (11) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). Also they retain water solubility after long-term boiling in aqueous colutions and since they are also soluble in organic solvents but profited at high acit concentration, they are easily extracted and purified. The modular construction of the invention facilitates unfortable to purification or modulate solubility. This sequences, e.g. to simplify contained in the contained or solubility. This sequence represents the contained or solubility. This sequence represents the contained or solubility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    15;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               used
                                                                                                                                                                                                                                                                   New DNA encoding synthetic spider silk protein, useful e.g. for closing wounds, comprises modules that encode repeating units of spidroin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               164

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel DNA sequence, encoding a synthetic spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotides, each oligonucleotide encoding a repeating unit of a spidroin protein. The synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (11) as adhesion surfaces for culturing cells; and artificial organs; (11) as adhesion surfaces for culturing cells; and (11) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). CC fibres with excellent mechanical properties (strength and elasticity). CC Also they retain water solubility after long-term boiling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high sait concentration, they are easily extracted and comportation of additional peptide-encoding sequences, e.g. to simplify purification or modulate solubility. This sequence represents the construction of the invention facilitates as synthetic construction of the invention facilitates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New DNA encoding synthetic spider silk protein, useful e.g. for closing wounds, comprises modules that encode repeating units of spidroin

                                                                                                                                                                                             ð
                                       ð
                                                                                                                                     The invention relates to a method of producing silk-like proteins (SLP) in a green plant by providing a green plant containing an SLP expression cassette. The green plant contains the expression cassette P-SLP-T where P is a promoter for driving the expression of an SLP transgene and T is a 5' terminator. The method is useful for producing silks and silk-like proteins in green plants. The silks and silk-like proteins may be used in fabrics or in material construction, such as rope, surgical sutures, flexible tie downs for certain electrical components, or as a biomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is the silk protein Dragline protein (DP) 1 synthetic variant DPLB/his tag 8mer (i.e. 8 copies of DPLB with a His tag at the C-terminus) which is used as an SLP construct in the method of the

The invention relates to a method of producing silk-like proteins (SLP) in a green plant by providing a green plant containing an SLP expression cassette. The green plant contains the expression cassette P-SLP-T where P is a promoter for diving the expression of an SLP transgene and T is a S' terminator. The method is useful for producing silks and silk-like proteins in green plants. The silks and silk-like proteins may be used in fabrics or in material construction, such as rope, surgical sutures, flexible tie downs for certain electrical components, or as a biomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is the silk protein Dragline protein (DP) i synthetic variant DPIB/his tag 16mer (i.e. 16 copies of DPIB with a His tag at the C-terminus) which is used as an SLP construct in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20;

squentially arranged oligonucleotides, each comprising a synthetic sequentially arranged oligonucleotides, each comprising a group of a sequentially arranged oligonucleotides, each oligonucleotide encoding a repeating unit of a spidroin protein. The synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (ii) as adhesion surfaces for culturing cells; and clinis as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). Calso they retain water solubility after long-term boiling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high salt concentration, they are easily extracted and incorporation of additional peptide-encoding sequences, e.g. to simplify the protein or modulate solubility. This sequence represents the concentration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           14;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ints lines the describes a move that sequence, encouring a synthaetic sequentially arranged oligonucleotides, each comprising a group of sequentially arranged oligonucleotides, each oligonucleotide encoding a sequentially arranged oligonucleotides, each oligonucleotide encoding carepeating unit of a spidroin protein. The synthetic protein has at to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (ii) as adhesion surfaces for culturing cells; and (iii) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). Also they retain water solubility after long term boiling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high salt concentration, they are easily extracted and purification of additional peptide-encoding sequences, e.g. to simplify unification or modulate solubility. This sequence represents a construct composed of the LeB4 signal peptide, N. clavipes spidroin-I synthetic homologue SOL, a c-Myctag and an endoplasmic reticulum (ER)-retention signal described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New DNA encoding synthetic spider silk protein, useful e.g. for closing wounds, comprises modules that encode repeating units of spidroin

                                                                          The invention relates to a method of producing silk-like proteins (SLP) in a green plant by providing a green plant contains the expression cassette. The green plant contains the expression cassette P-SLP-T where P is a promoter for driving the expression of an SLP transgene and T is a 5' terminator. The method is useful for producing silks and silk-like proteins in green plants. The silks and silk-like proteins may be used in fabrics or in material construction, such as rope, surgical sutures, flexible tie downs for certain electrical components, or as a biomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is the silk protein Dragline protein (DP) I synthetic variant DPIB Bmar (i.e. 8 copies of DPIB) which is used as an SLP construct in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          184 AGAAAAAAGGAGGGYGGLGSQGAGQGGYGGLGSQGAGGGGGGGGGGAGAAAAAAGGAGQ 243

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 2, A Sequence 19, A Sequence 11, A Sequence 13, Sequence 21, A Sequence 21, A Sequence 2, A Sequence 2, A Sequence 4, A Sequence 4, A Sequence 31, Sequence 31, Sequence 31, Sequence 31, Sequence 64, Seque

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1, Application US/09247806

Patent No. 6280747

GENERAL INFORMATION:
APPLICANT: PHILLIPPE, Michel
APPLICANT: ARRAUDEAU, Jean-Claude
APPLICANT: ARRAUDEAU, Jean-Plerre
TITLE OF INVENTION: COSMETIC OR DERMATOLOGICAL COMPOSITION CONTACTING AT
TITLE OF INVENTION: LEAST ONE NATURAL OR RECOMBINANT SPIDER SILK OR AN
TITLE OF INVENTION: ANALOG
FILE REPERBERCE: 6388-0365-0
CURRENT PILING DATE: 1999-02-11
SARLIER RAPLICATION NUMBER: FR 98/01614
EARLIER FILING DATE: 1998-02-11
NUMBER OF SEQ ID NOS: 14
SOFTWARE: PATENTIN VEY: 2.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          15;

                                                                                                                                                                                                                                                                                                                                                          Sequence 4, Application US/08317844B
Patent No. 598984
GENERAL INFORMATION:
APPLICANT: Lewis, Randolph V.
APPLICANT: Xu, Ming
APPLICANT: ALIMON, Ming
APPLICANT: Hinman, Michael B.
TITLE OF INVENTION: ISOLATED DNA CODING FOR SPIDER SILK
TITLE OF INVENTION: PROTEIN, A REPLICABLE VECTOR AND A TRANSFORMED CELL
TITLE OF INVENTION: CONTAINING THE ISOLATED DNA, AND PRODUCTS THEREOF
NUMBER OF SEQUENCES: 62
CORRESPONDENCE ADDRESS:
ADDRESSEE: Birch, Stewart, Kolasch & Birch
